## 7 Machine learning in automated text categorization

Fabrizio Sebastiani

March 2002

ACM Computing Surveys (CSUR), Volume 34 Issue 1

Full text available:  pdf(524.41 KB)

Additional Information: full citation, abstract, reference

The automated categorization (or classification) of texts into predefined categories has become a popular task in the last 10 years, due to the increased availability of documents in digital form. In the research community the dominant approach to this problem is based on an inductive process: automatically build a classifier by learning from a set of previously classified documents. This paper surveys the state-of-the-art of this research, and discusses the challenges and future directions of this research.

Constantly improving gene expression profiling technologies are providing a better understanding and insight into cancer related cellular processes. This is expected to significantly aid in the development of efficient cancer diagnosis platforms. In this work we examine two sets of gene expression data: one from tumor and normal clinical samples. One set consists of 2,000 genes from colon samples [1]. The second consists of 2,000 genes from breast samples [2].

We explore how to organize large text databases hierarchically by topic to aid in information retrieval. Many corpora, such as internet directories, digital libraries, and patent databases, are organized hierarchically, also called *taxonomies*. Similar to indices for relational data, taxonomies are efficient. However, the exponential growth in the volume of on-line textual information makes it difficult to maintain such taxonomies.

This paper explores the use of hierarchical structure for classifying collection of web content. The hierarchical structure is initially used by classifiers. In the hierarchical case, a model is learned to distinguish other categories within the same top level. In the flat non-hierarchical case, a second-level category is learned from all other second-level categories. ...

Support vector machines (SVMs) excel at two-class discriminative learning problems. However, they are not suitable for multi-class classification. On the other hand, generative classifiers have no trouble in handling an arbitrary number of classes. In this paper, we propose a novel multi-class SVM that can be trained much faster than SVMs owing to their extreme simplicity. In contrast, SVMs require a large number of support vectors. The proposed SVM learning is redundant yes/ no.

We introduced a novel method employing a hierarchical domain ontology structure to extract features from documents in our previous publication (Wang 2002). All raw words in the training documents are mapped to a concept hierarchy derived from the domain ontology. Based on these concepts, we reduce the dimensionality of the training document space, using is-a relationships defined in the domain ontology. The features obtained by searching the concept hierarchy are used for classification.
